

**MARK-UP PAGES FOR THE AUGUST 23, 2002, AMENDMENT TO
U.S. PATENT APPLICATION SER. NO. 09/765,263**

The replacement for the third full paragraph of page 13 resulted from the following changes:

Among the several features that the vapor-chamber base 160 forms is a vertical transfer-pump port 164, through which the drive rod 146 extends. That rod extends into a transfer pump 166 that Fig. 14 omits but Fig. 15 illustrates in cross section. The transfer pump 166 includes an upper cylinder half 168 that forms a cylindrical lip 169, which mates with the transfer-pump port 164 of Fig. 14. It also forms a flange 170 by which a bolt 172 secures it to a corresponding flange 174 formed on a lower cylinder half 176. Fig. 15 also depicts a mounting post 178, which is one of two that are secured to Fig. 14's vapor-chamber base 160 and support the transfer pump 1466 by means of flanges, such as flange 180, formed on the upper cylinder half 168.
